M	There shall be no explosion or other hazard to either personnel or the facility		N/A

IEC 61643-11 - TEST SEQUENCE 7
Additional tests for outdoor use SPDs

Clause	Requirement - Test	Result - Remark	Verdict
7.5.2/8.6.2	Environmental tests for outdoor SPDs (informative)		
F.1	Accelerated aging test with UV radiation		
	Expose three complete SPDs, as to be installed for outdoor use, to 1000 h of UV radiation (UV-B) and water spray as follows: 500 cycles of 120 min each, consisting of 102 min of UV light at 60 °C, 18 min of UV light and water spray at 65 °C and 65 % RH. The UV radiation shall be according to ISO 4892-2, method A. ISO 4892-1 and ASTM 151 are to be used for general guidance for the test.		N/A
	The samples shall be connected to a power source at Uc during the test and residual current shall be monitored at 120 min intervals. After completion of this test, the samples shall be tested according to F.2.		N/A
	Pass criteria		
	During and after the test, the samples shall be visually inspected for voids, cracks, tracking and surface erosion. The residual currents shall not increase by more than 10%. The degree of tracking, surface erosion and cracking shall be assessed to determine if this will compromise the enclosure of the product to meet the other electrical and mechanical performance requirements of this standard.		N/A
F.2	Water immersion test		
	The test is performed in accordance with Figure 8 of IEC 60099-4. The test samples shall be kept immersed in a vessel, in boiling de-ionized water with 1 kg/m³ of NaCl, for 42 h.		N/A
	At the end of boiling, the SPD shall remain in the vessel until the water has cooled down to approximately 20 °C (\pm 15 °C) and shall be maintained in the water till the verification tests are performed. After the water immersion test the samples shall be subjected to the dielectric test (see F.3).		N/A

IEC 61643-11 - TEST SEQUENCE 7
Additional tests for outdoor use SPDs

Clause	Requirement - Test	Result - Remark	Verdict
F.3	Dielectric test		
	<p>The test samples shall be subjected to a dielectric test at a power frequency sinusoidal voltage of 1000 V plus twice the reference test voltage U_{REF} for 1 min and the leakage current shall be measured. The test voltage shall be applied as follows:</p> <ul style="list-style-type: none"> a) SPD with metallic housing with or without mounting bracket The voltage shall be applied between all terminals or external leads which are not internally connected to the housing, neither directly nor through surge protective components, connected together, and the metallic housing. If all terminals and external leads are connected directly or through components to the conductive housing, this test is not performed. b) SPD with non-conductive housing with non-conductive or without mounting bracket The non-conductive housing shall be tightly wrapped in conductive foil to within 15 mm of any non-insulated lead or terminal. The voltage shall be applied between the conductive foil and all terminals or external leads connected together. c) SPD with non-conductive housing with metallic mounting bracket The non-conductive housing shall be tightly wrapped in conductive foil to within 15 mm of any non-insulated lead, terminal and the metallic mounting bracket. The voltage shall be applied between the conductive foil and all terminals, external leads and mounting bracket connected together. 	N/A	N/A
	Pass criteria		N/A
	The leakage current measured during this test shall not exceed 25 mA.	I = _____ mA	N/A
F.4	Temperature cycle test		
	The test shall be performed according to IEC 60068-2-14 with 5 cycles with a lower temperature of -40 °C and with an upper temperature of +100 °C. The time duration for each half cycle is 3 h and the temperature change shall occur within 30 s.		N/A

IEC 61643-11 - TEST SEQUENCE 7
Additional tests for outdoor use SPDs

Clause	Requirement - Test	Result - Remark	Verdict
	Pass criteria		
	During and after the test, the samples shall be visually inspected for voids, cracks, tracking and surface erosion. The residual currents shall not increase by more than 10 %. The degree of tracking, surface erosion and cracking shall be assessed to determine if this will compromise the enclosure of the product to meet the other electrical and mechanical performance requirements of this standard.		N/A
F.5	Verification of resistance to corrosion		
	<p>SPDs with exposed metal parts shall be subjected to the test and shall be mounted as for normal use according to the manufacturer's instructions.</p> <p>The enclosure or samples shall be new and in a clean condition. The samples shall be subjected to the following test:</p> <ul style="list-style-type: none"> • 12 cycles of 24 h, damp heat cycling test according to test Db of IEC 60068-2-30 at 40 °C and relative humidity of 95 % • 14 cycles of 24 h, salt mist test according to test Ka of IEC 60068-2-11 at a temperature of (35 ± 2) °C. <p>After the test, the samples shall be washed in running tap water for 5 min, rinsed in distilled or demineralized water then shaken or subjected to air blast to remove water droplets. The specimen under test shall then be stored under normal service conditions for 2 h.</p>		N/A
	Pass criteria		
	<p>Compliance is checked by visual inspection to ensure that:</p> <ul style="list-style-type: none"> • there is no evidence of rust, cracking or other deterioration. However, surface deterioration of any protective coating is allowed. In case of doubt, reference shall be made to ISO 4628-3 to verify that the samples conform to the specimen R1; • seals are not damaged; • any moving parts (disconnectors) work without abnormal effort. A = applicable

- = not applicable

O = optional

^a external disconnectors connected means that all disconnectors as specified by the manufacturer shall be tested with the SPD during the type tests, except for RCDs, which are not tested during the operating duty test according to 8.3.4.

^b For these tests initial measurements of leakage currents according to Table 4, pass criterion E may be necessary.

^c For this test sequence more than one set of samples may be needed.

TÜVRheinland®

Report No. 50189621 003

Page 77 of 60

Rubrica

Table 4 – Common partial criteria for type tests

A	Thermal stability shall be achieved. The SPD is considered to be thermally stable if the crest of the resistive component of the current flowing into the SPD or the power dissipation shows either a decreasing tendency or does not increase during 15 min at U_C voltage application immediately after the application of U_C . If the test itself is performed with the SPD energized at U_C , then U_C either remains applied for these 15 min without interruption or is reapplied within less than 30 s.
B	Voltage and current records and visual inspection shall show no indication of puncture or flashover.
C	No visible damage shall occur during the test. After the test, small indents and cracks not impairing the protection against direct contact are disregarded during this check, unless the degree of protection (IP-code) given for the SPD is no longer provided. There shall be no visual evidence of burning of the sample after the test.
D	Values for measured limiting voltage after the test shall be below or equal to U_P . The measured limiting voltage shall be determined, using the tests described in 8.3.3, but the test of 8.3.3.1 is performed only with a 8/20-surge current with a crest value of I_{imp} for Test Class I or with I_h for Test Class II or with the test of 8.3.3.3 but only at U_{OC} for Test class III.
E	No excessive leakage currents shall occur after the test. The SPD shall be connected as for normal use according to the manufacturer's instructions to a power supply at the reference test voltage (U_{REF}). The current that flows through each terminal is measured. Its resistive component (measured at the crest of the sine wave) shall not exceed a value of 1 mA, or the current shall not have changed by more than 20 % compared to the initial value determined at the beginning of the relevant test sequence.
F	Any resettable or rearmable disconnector shall be switched off manually, if applicable, and the dielectric withstand shall be checked by application of two times U_C or 1 000 V a.c., whichever is greater. During the test, no flashover, breakdown of insulation either internally (puncture) or externally (tracking) or any other manifestation of disruptive discharge shall occur. In addition for SPD modes connected N-Pe only the current through the PE-terminal shall be measured, whereas the terminals are connected to a power supply at the maximum continuous operating voltage (U_C). Its resistive component (measured at the crest of the sine wave) shall not exceed a value of 1 mA, or the current shall not have changed by more than 20 % compared to the initial value determined at the beginning of the relevant test sequence. If there is more than one possible connection arrangement for normal use, this check shall be performed for all arrangements.
G	External disconnectors as specified by the manufacturer shall not operate during the test and shall be in working order after the test. For the purpose of this clause, working order means that there is no damage to the disconnector and that it is still operational. Operation can be checked either manually (where possible) or by a simple electrical test agreed between the manufacturer and the laboratory.
H	Internal disconnectors as specified by the manufacturer shall not operate during the test and shall be in working order after the test. For the purpose of this clause, working order means that there is no damage of the disconnector and that it is still operational. Operation can be checked either manually (where possible) or by a simple electrical test agreed between the manufacturer and the laboratory.
I	SPDs with an IP degree equal to, or greater than, IP20 shall not have live parts accessible with the standardized test finger applied with a force of 5 N (see IEC 60529), except the live parts which were already accessible before the test when the SPD is fitted as in normal use.
J	If disconnection (internal or external) occurs during the test, there shall be clear evidence of effective disconnection of the corresponding protective component(s). If internal disconnection occurs, the test sample is connected as for normal use at the maximum continuous operating voltage U_C and at rated frequency for 1 min. The test source shall have a short-circuit current capability equal or greater than 200 mA. The current that flows through the relevant protective components shall not exceed a value of 1 mA.
K	Currents through components connected in parallel to the relevant protective component(s), or otherwise connected (e.g. indicator circuits), are disregarded for this measurement, as long as they cannot cause a current through the relevant protective component(s).
L	In addition the current through the PE-terminal, including parallel circuits and other circuits (e.g. indicator circuits), if any, shall not exceed 1 mA. If there is more than one possible connection arrangement for normal use, this check shall be performed for all arrangements.
M	The short-circuit current from the power source, if any, shall be interrupted within 5 s by one or more internal and/or external disconnector(s).
N	The tissue paper shall not catch fire.
O	There shall be no explosion or other hazard to either personnel or the facility.
P	There shall be no flashover to the metallic screen and the 6 A gL/gG fuse connecting the screen shall not operate during the test.
Q	After completion of this test the samples shall be allowed to return to room temperature and be connected to a power source at U_C for 2 h. The residual current shall be monitored and not exceed the value measured at the beginning of the test by more than 10 %.

Table 11 - Cross-sections of copper conductors for screw-type or screwless terminals.

A Maximum continuous load current for two-port SPDs or one-port SPDs with separate input/output terminals ^a	Range of nominal cross-sections to be clamped (single conductor)	
	mm ²	American Wire Gauge
Up to and including 13	1 to 2,5	18 to 14
Above 13	up to and including 16	1 to 4
Above 16	up to and including 25	1,5 to 6
Above 25	up to and including 32	2,5 to 10
Above 32	up to and including 50	4 to 16
Above 50	up to and including 80	10 to 25
Above 80	up to and including 100	16 to 35
Above 100	up to and including 125	25 to 50

^a It is required that, for current ratings up to and including 50 A, terminals be designed to clamp solid conductors as well as rigid stranded conductors; the use of flexible conductors is permitted.
Nevertheless, it is permitted that terminals for conductors having cross-sections from 1 mm² up to 6 mm² be designed to clamp solid conductors only.

Table 12 - Pulling forces (screw terminals)

Cross-section of conductor accepted by the terminal mm ²	Up to 4	Up to 6	Up to 10	Up to 16	Up to 50
Pull N	50	60	80	90	100

Table 13 - Conductor dimensions

Range of nominal cross-sections to be clamped mm ²	Stranded conductor	
	Number of wires	
1 to 2,5	7	
1 to 4	7	
1,5 to 6	7	
2,5 to 10	7	
4 to 16	7	
10 to 25	7	
16 to 35	19	
25 to 50	Under consideration	

^a If the terminal is intended to clamp solid conductors only (see table footnote of Table 11), the test is not performed.

Report No. 50189621 003

Page 60 of 86

Table 14 - Tension force (screwless terminals)

Cross-sectional area mm ²	0,5	0,76	1,0	1,25 1,6	2,0 2,5	3,5 4	5,5 6	8,0 10	14 16	22 25	35 38
Pull force N	30	30	35	40	50	60	80	90	100	135	190

Table 15 – Air clearances for SPDs

U_{max} ^a	$\leq 2\ 000\ V$	$\leq 4\ 000\ V$	$>4\ 000\ V$ up to 6 000 V	$>6\ 000\ V$ up to 8 000 V
Air clearances in millimetres				
1) Between live parts of different polarity	1,5	3	5,5	8
2) Between live parts and				
– screws and other means to fasten a covering, having to be detached for mounting the SPD	1,5	3	5,5	8
– fastening surfaces (NOTE 2)	3	6	11	16
– screws or other means for fastening the SPD (NOTE 2)	3	6	11	16
– bodies (NOTES 1 and 2)	1,5	3	5,5	8
3) Between the metal parts of the disconnector mechanism and				
– bodies (NOTE 1)	1,5	3	5,5	8
– screws or other means for fastening the SPD	1,5	3	5,5	8

^a This column is only applicable for SPDs with U_C lower or equal to 180 V.

NOTE 1 For definition, see 8.3.6 a)

NOTE 2 If clearances between live parts of the device and the metallic screen or the surface on which the SPD is mounted are dependent on the design of the SPD only and cannot be reduced when the SPD is mounted in the least favourable position (even in a metallic enclosure), the values of line 1) are sufficient.

^a For further information on material groups refer to Table 17.

^b This voltage is for functional insulation, the working voltage; for basic and supplementary insulation of the circuit energized directly from the supply mains, the voltage rationalized through Table F.3a or Table F.3b of IEC 60664-1, based on the rated voltage of the equipment, or the rated insulation voltage; for basic and supplementary insulation of systems, equipment and internal circuits not energized directly from the mains, the highest r.m.s. voltage which can occur in the system, equipment or internal circuit when supplied at rated voltage and under the most onerous combination of conditions of operation within equipment rating.

^c For the main protection circuit, this column refers to U_C .

^d Material IIIb shall not be used for application in pollution degree 3 above 630 V.

NOTE If the actual voltage differs from the values given in the table, it is allowed to interpolate values for intermediate voltages. When interpolating, linear interpolation should be used and values should be rounded to the same number of digits than the values picked from the table.

**Table 17 – Relationship between material groups and classifications**

Material group I	$600 \leq CTI$
Material group II	$400 \leq CTI < 600$
Material group IIIa	$175 \leq CTI < 400$
Material group IIIb	$100 \leq CTI < 175$

Relationship between material groups and classifications are according to IEC 60112 (CTI values, using solution A).

Table 18 – Fall distances for impact requirements

Height of fall mm	Parts of enclosures to be subjected to the impacts	
	Ordinary accessory	Other accessories
100	A and B	A and B
150	C	C
200	D	D

A: parts on the front surface, including parts which are recessed.

B: parts which do not project more than 15 mm from the mounting surface (distance from the wall) after mounting as in normal use, with the exception of the above parts A.

C: parts which project more than 15 mm and not more than 25 mm from the mounting surface (distance from the wall) after mounting as in normal use, with the exception of the above parts A.

D: parts which project more than 25 mm from the mounting surface (distance from the wall) after mounting as in normal use, with the exception of the above parts A.

Table 19 – Test conductors for rated load current test

Test current [A]		Cross section		F1s
Greater than	Less or equal:	[mm ²]	AWG/MCM	
0	8	1.0	18	
8	12	1.5	16	
12	15	2.5	14	
15	20	2.5	12	
20	25	4.0	10	
25	32	6.0	10	
32	50	10	8	
50	65	16	6	
65	85	25	4	
85	100	35	3	
100	115	35	2	
115	130	50	1	
130	150	50	0	
150	175	70	00	
175	200	95	000	
200	225	95	0000	
225	250	120	250	
250	275	150	300	
275	300	185	350	
300	350	185	400	
350	400	240	500	

NOTE If other standardized cross-sections are used in specific countries, the next closest cross-section should be used for testing.

Table 20 – Current factor *k* for overload behaviour

Protective device	Trip current factor <i>k</i>
Circuit breaker	1.45
Fuse	1.6

NOTE 1 If the type of protective device (breaker or fuse) is not specified by the manufacturer, the test is performed with the higher *k* factor.

NOTE 2 For countries using other values, these values should be declared on the SPD's data sheet according to 7.1.1 c7).

NOTE 3 National condition for Japan: *k* is 1.25 for circuit-breaker and 1.5 for fuse.

NOTE 4 National condition for North America: *k* is under consideration.

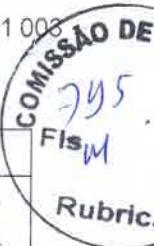

Table 21 -- Tolerances for proportional surge currents

Test classification	Proportional currents and tolerances		
Test class I	$I_{imp(1)} = I_{imp(2)} = I_{imp(N)} = I_{Total(imp)} / N$	10 %	
	$Q_{(1)} = Q_{(2)} = Q_{(N)} = Q_{Total} / N$	-10/+20 %	
	$W/R_{(1)} = W/R_{(2)} = W/R_{(N)} = W/R_{Total} / N^2$	-10/+45 %	
Test class II	$I_{8/20(1)} = I_{8/20(2)} = I_{8/20(N)} = I_{Total(8/20)} / N$	$\pm 10\%$	

Table B.1 – TOV test values for systems complying with IEC 60364 series

Application	TOV test parameters		
SPDs connected to:	For $t_T=5$ s (LV-system faults in consumer installation) (requirement to 7.2.8.1 and test 8.3.8.1)	For $t_T=120$ min (LV-system faults in distribution system and loss of neutral) (requirement to 7.2.8.1 and test 8.3.8.1)	For $t_T=200$ ms (HV-system faults) (requirement to 7.2.8.2 and test 8.3.8.2)
	Withstand mode required	Withstand or safe failure mode acceptable	Withstand or safe failure mode acceptable
TOV test values U_T (V)			
TN-systems			
Connected L-(PE)N or L-N	$1,32 \times U_{REF}$	$\sqrt{3} \times U_{REF}$	
Connected N-PE			
Connected L-L			
TT-systems			
Connected L-PE	$\sqrt{3} \times U_{REF}$	$1,32 \times U_{REF}$	$1,200 + U_{REF}$
Connected L-N	$1,32 \times U_{REF}$	$\sqrt{3} \times U_{REF}$	
Connected N-PE			1 200
Connected L-L			
IT-systems			
Connected L-PE			$1,200 + U_{REF}$
Connected L-N	$1,32 \times U_{REF}$	$\sqrt{3} \times U_{REF}$	
Connected N-PE			$1,200 + U_{REF}$
Connected L-L			
U_{REF}	reference test voltage used for testing and taking into account the maximum voltage regulation of the power system (see Annex A).		
U_0	In TN- and TT-systems: nominal a.c. r.m.s. line voltage to earth; in IT-systems: nominal a.c. voltage between line conductor and neutral conductor or midpoint conductor, as appropriate (see 442.1.2 of IEC 60364-4-44:2007).		
$1,32 \times$	U_{REF} equals $1,45 \times U_0$ in case the voltage regulation does not exceed +10 % (see 442.5 of IEC 60364-4-44:2007).		
NOTE	As voltage regulation exceeds 10 % in some countries, only U_{REF} is used in this standard for general applicability. Further information on voltage regulation can be found in IEC 60038.		

**Table B.3 – TOV test parameters for Japanese systems**

Application	TOV test parameters							
	LV system faults for $t_T \leq 120$ min	HV system faults						
SPDs connected to:	Not specified duration	for $t_T = 2$ s	for $t_T = 1$ s					
	(LV-system faults in distribution system and loss of neutral (requirement to 7.2.8.1 and test 8.3.8.1)	Withstand or safe failure mode acceptable						
TOV test values U_T [V]								
TN systems								
Connected L-N(PE) or L-N	$\sqrt{3} \times U_{REF}$							
Connected N-PE								
Connected L-L								
TT systems								
Connected L-PE	$\sqrt{3} \times U_{REF}$	$150 + U_{REF}$	$300 + U_{REF}$	$600 + U_{REF}$				
Connected L-N	$\sqrt{3} \times U_{REF}$							
Connected N-PE		150	300	600				
Connected L-L								
IT systems								
Connected L-PE				$1\ 200 + U_{REF}$				
Connected L-N	$\sqrt{3} \times U_{REF}$							
Connected N-PE				$1\ 200 + U_{REF}$				
Connected L-L								
U_{REF}	reference test voltage used for testing and taking into account the maximum voltage regulation of the power system (see Annex A).							
NOTE 1 These values are required by ministerial ordinance of technical standards for electrical facilities.								
NOTE 2 As voltage regulation exceeds 10 % in some countries, U_{REF} is used in this standard only for general applicability. Further information on voltage regulation can be found in IEC 60038.								

Table 11 - Temperature-rise limits

Parts of SPD	Temperature rise K
Built-in components ^a	In accordance with the relevant product standard requirements for the individual components or, in accordance with the component manufacturer's instructions ^f , taking into consideration the temperature in the SPD
Terminals for external insulated conductors	70 ^b
Busbars and conductors, plug-in contacts of removable or withdrawable parts which connect to busbars	Limited by: <ul style="list-style-type: none"> - mechanical strength of conducting material^g; - possible effect on adjacent equipment; - permissible temperature limit of the insulating materials in contact with the conductor; - effect of the temperature of the conductor on the apparatus connected to it; - for plug-in contacts, nature and surface treatment of the contact material.
Manual operating means: <ul style="list-style-type: none"> - of metal - of insulating material 	15 ^c 25 ^d
Accessible external enclosures and covers: <ul style="list-style-type: none"> - metal surfaces - insulating surfaces 	30 ^e 40 ^d
Discrete arrangements of plug and socket-type connections	Determined by the limit for those components of the related equipment of which they form part ^e

^a The term "built-in components" means:

- conventional switchgear and controlgear;
- electronic sub-assemblies (e.g. rectifier bridge, printed circuit);
- parts of the equipment (e.g. regulator, stabilized power supply unit, operational amplifier).

^b An SPD used or tested under installation conditions may have connections, the type, nature and disposition of which will not be the same as those adopted for the test, and a different temperature rise of terminals may result. Where the terminals of the built-in component are also the terminals for external insulated conductors, the lower of the corresponding temperature-rise limits shall be applied.

^c Manual operating means within SPDs which are only accessible after the SPD has been opened, for example draw-out handles which are operated infrequently, are allowed to assume a 25 K increase on these temperature-rise limits.

^d Unless otherwise specified, in the case of covers and enclosures, which are accessible but need not be touched during normal operation, a 10 K increase on these temperature-rise limits is permissible.

^e This allows a degree of flexibility in respect of equipment (e.g. electronic devices) which is subject to temperature-rise limits different from those normally associated with switchgear and controlgear.

^f For temperature-rise tests according to 8.6.1.1, the temperature-rise limits shall be specified by the manufacturer of the SPD.

^g Assuming all other criteria listed are met, a maximum temperature rise of 105 K for bare copper busbars and conductors shall not be exceeded. The 105 K relates to the temperature above which annealing of copper is likely to occur.

Annex 1: Voltage protection level test curve

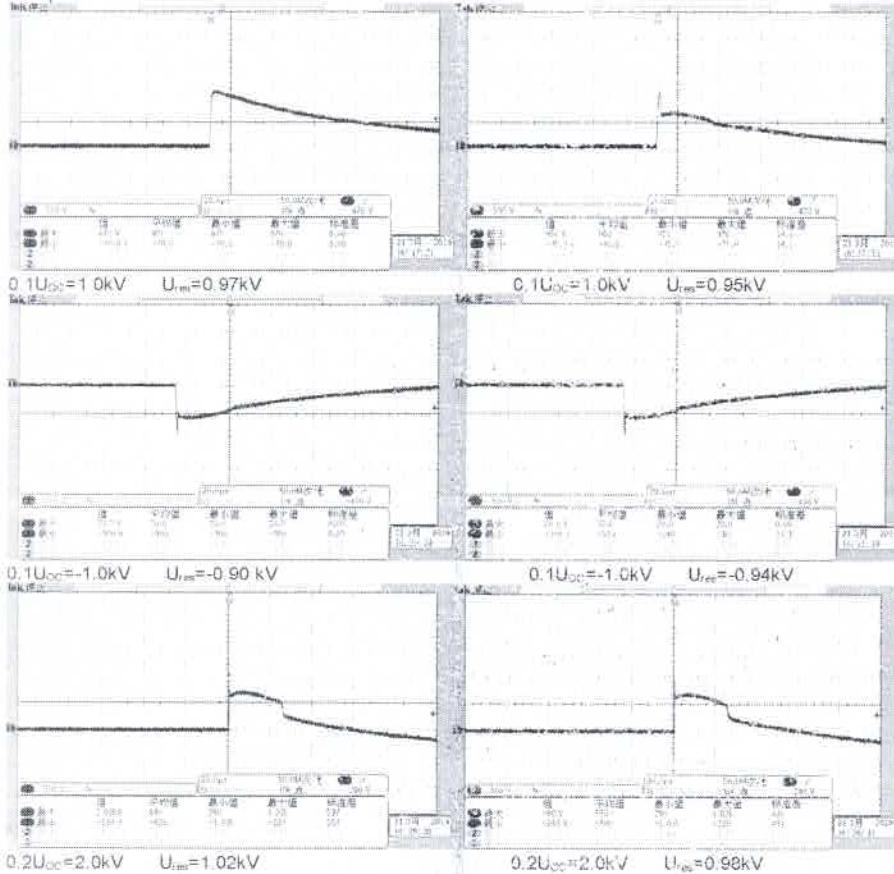

The test current is 0.1;0.2;0.5;1.0 times I_{mp} . If the SPD contains only voltage-limiting components, this test needs only to be performed at crest values of I_i for test class II or I_{mp} for test class I, and one positive and negative polarity are applied to the SPD. The voltage of the combination wave generator is set to provide an open-circuit voltage of 0.1;0.2;0.5;1.0 times the U_{OC} . If the SPD contains only voltage-limiting components, this test needs only to be performed at U_{OC} .

IEC61643_11B - ATTACHMENT

Clause	Requirement + Test	Result - Remark	Verdict
7.2.2	Residual current I_{PE} This test is not performed on SPDs for connection N-PE only		P
	For all SPDs with a terminal for the protective conductor, the residual current I_{PE} shall be measured when all SPD terminals are connected to a power supply at the reference test voltage (U_{REF}) according to the manufacturer's instructions.		P
8.3.2	All modes of protection of the SPD shall be connected as for normal use according to the manufacturer's instructions. The line to PE voltage of the supply system shall be adjusted to the reference test voltage U_{REF} .		P N/A
7.2.4/8.3.4	Operating duty The SPD shall be capable of withstanding specified discharge currents during application of the maximum continuous operating voltage U_c without unacceptable changes in its characteristics. In addition voltage switching type SPDs or combination type SPDs shall be able to interrupt any follow current up to the short-circuit current rating (I_{scrr}) The test setup shall comply with the circuit diagram given in Figure 7.		P
8.3.4.2.2	SPDs with follow current > 500A: The test sample shall be connected to a power frequency voltage at U_c with a prospective short-circuit current equal to the short circuit current rating I_{scrr} declared by the manufacturer and with a power factor in accordance with Table 8, except for SPDs which are only connected between neutral and protective earth in TT- and/or TN-systems, for which the prospective short-circuit current shall be at least 100A.	_____ kA $\cos \phi = _____$	N/A N/A
7.3.4/8.4.3	Verification of air clearances and creepage distances		
	The air clearances and creepage distances shall not be smaller than the values indicated in Table 15 and Table 16, whereby Table 16 shall be applied to items 1), 2) and 3) according to Table 15.	Single pvc cord, not applicable	N/A

Clause	Requirement + Test	Result - Remark	Verdict
	One sequence of positive polarity and one sequence of negative polarity are applied to the SPD		N/A
	When I_{max} is declared by the manufacturer an additional 8/20 current impulse with a crest value of I_{max} shall be applied and the polarity that showed higher residual voltages in the previous tests.		N/A
	The interval between individual impulses shall be long enough for the sample to cool down to ambient temperature.		N/A
	Current and voltage oscillogram		N/A
	Crest values – discharge current versus residual voltage diagram to I_n or I_{imp}		N/A
	The residual voltage used for determining the measured limiting voltage is the highest voltage value corresponding to the range of currents for: <ul style="list-style-type: none">• class I: up to I_{imp}• class II: up to I_n		N/A
	The value for determining U_{max} is the highest residual voltage measured at surge currents up to I_n , I_{max} or I_{imp} , as applicable depending on the SPD test class.		N/A
7.5.1.2	Overload behaviour		
	If an external maximum overcurrent protection is specified by the manufacturer, the SPD shall be loaded for 1 h with a current equal to 1,6 times the rated current of that maximum overcurrent protection.		N/A
8.3.5.3	a) Test at the declared short-circuit current rating		
	The test is carried out twice with U_{REF} applied once at (45 ± 5) electrical degrees and once at (90 ± 5) electrical degrees after the zero crossing of the voltage.		N/A
8.3.5.3.2	Additional test for SPD's failure mode simulation		
	For this test any electronic indicator circuitry may be disconnected.		P
	New samples shall be used and fitted as in normal use, acc. to the manufacturer's instructions and connected with conductors of the maximum cross section acc. to 8.4.2. The maximum length of the cables connection the sample shall be of 0,5 m each.		P

IEC61643_11B - ATTACHMENT			
Clause	Requirement + Test	Result - Remark	Verdict
	External disconnectors, if recommended by the manufacturer, shall be used.	—	P
	The test sample shall be connected to a power frequency voltage source at the following conditioning voltages: <ul style="list-style-type: none">• SPDs rated U_c up to 440V, apply a voltage equal to 1200 V_{rms} $\pm 5\%$• SPDs with U_c rated above 440V, apply a voltage equal to 3 times U_c $\pm 5\%$	1200V	P N/A
	For all types of SPDs with U_c up to 180V, the conditioning voltage may be reduced to 600V if for voltage switching type SPDs and for combination type SPDs, any voltage switching components operate at this voltage.		N/A
	The conditioning voltage is applied for a duration of 5 s $\pm 5\%$. The prospective short-circuit current of this power source for conditioning shall be adjusted to a value between 1 A and 20 A _{rms} $\pm 5\%$, as provided by the manufacturer according to 7.1.1 d5).	1A	P
	Following the application of the conditioning voltage equal to $U_{REF} \pm 5\%$ with a short-circuit current capability as given below, shall be applied to the sample for a period of 5 min $\pm 5\%$ or for at least 0,5 s after interruption of the current by an internal or external disconnector.		P
	The transition from conditioning voltage application to U_{REF} application shall be performed without interruption. The current flow through the SPD shall be monitored. An appropriate test circuit and timing diagram is shown in Figure 12 and Figure 13.		P
	The prospective short-circuit current of the power source at U_{REF} shall have a tolerance of $\pm 5\%$ at the location where the SPD is connected. The power factor of the power source shall comply with Table 8.		P
	Each of the following tests shall be performed on a new set of three preconditioned samples as above at U_{REF} with a short-circuit current of 100A, 500A and 1000A, respectively, unless these values exceed the declared short-circuit rating of the SPD.	100A	P
	A further test shall be performed on three preconditioned samples as above and at U_{REF} with a prospective short-circuit current equal to the manufacturer's declared short-circuit current rating. For this test, the time interval between the completion of the conditioning test and the application of U_{REF} shall be as short as possible and shall not exceed 100 ms.	300A	P

Condição do teste de vida útil			Resumo dos resultados				
Condição de testagem	Corrente (mA)	Temperatura do invólucro (°C)	Duração do teste (h)	Manutenção média de lumen (%)	Variação cromática máxima ($\Delta u'v'$)	Densidade de potência média (W/mm²)	Densidade média de corrente (mA/mm²)
1	160	55	14000	94,88%	0,0043	0,152	6,4
2	160	85	14000	94,45%	0,0046		
3	160	105	14000	93,84%	0,0048		

1. Número de fontes de luz em LED testadas

- 25 pacotes testados à temperatura real do invólucro de 54,3°C
- 25 pacotes testados à temperatura real do invólucro de 84,1°C
- 25 pacotes testados à temperatura real do invólucro de 104,6°C

2. Descrição das fontes de luz em LED

- Número da peça: S01-E50Q
- Tipo da peça: SMD-5050
- IF = 160mA, CCT (Nominal) = 2700K-25000K

3. Descrição dos equipamentos auxiliares

- 1) Sistema EVERFINE LT-200A de teste acelerado de vida útil para LEDs
- 2) Esfera integradora de 0,5.
- 3) Sistema fotométrico, colorimétrico e elétrico SENSING SPR-3000 para fontes de luz

4. Tempo de operação

Os SMD-5050s são ativados por uma corrente contínua constante.

- Número de unidades : 25 a 55°C, 85°C e 105°C
- Corrente de ativação: 160mA
- Tensão típica: 18V-36V

5. Condições ambientes incluindo fluxo de ar, temperatura e umidade relativa

O fluxo de ar mínimo é mantido na câmara.

A temperatura ambiente ao redor dos SMD-5050s dentro da câmara é controlada pelo fluxo de ar e as leituras do termopar são monitoradas.

- Temperatura do invólucro: Controlada a -2°C
- Temperatura do ar na cercanía: Controlada a -5°C
- Umidade relativa: < 65%RH
